

Scenario: Airline Booking System

A Passenger uses the airline booking system to search for flights and select a suitable option. After choosing a flight, the passenger proceeds to booking, where the system ensures all required steps are completed. During the booking, the passenger may choose a preferred seat or add extra baggage. If payment is unsuccessful, the system can provide alternative payment options. Additionally, an Airline Agent can assist the passenger in booking through the system.

University Course Registration System

Paragraph

A Student uses the university course registration system to sign in and view available courses. The student selects desired courses and adds them to the registration list. To complete registration, the system ensures that student information is verified, prerequisites are checked, and payment for tuition is processed. During registration, the student may choose to join a waitlist if a course is full. If the payment fails, the system can provide the option to use another payment method. An Academic Advisor can also assist the student with course registration through the system.

Hotel Reservation System

Paragraph

A Guest uses the hotel reservation system to log in and search for available rooms. The guest selects a room and proceeds to confirm the booking. To complete the reservation, the system verifies guest details and processes the payment. During the booking, the guest may request additional services such as breakfast or airport pickup. If the payment fails, the system may offer an alternative payment method. A Hotel Receptionist can also assist the guest with making reservations through the system.

Food Delivery App

Paragraph

A Customer uses a food delivery app to browse restaurants and select items for their order. After placing items in the cart, the customer proceeds to checkout. To complete the order, the system always verifies the customer's delivery address and processes the payment. During checkout, the customer may choose to apply a discount code or request special delivery instructions. If payment fails, the system may allow the customer to select another payment method. A Delivery Rider is then assigned to deliver the food, and Customer Support can assist the customer if needed.

Online Banking System

Paragraph

A Bank Customer logs into the online banking system to manage accounts. The customer can transfer money, pay bills, or check balances. To perform a money transfer, the system always verifies the customer's identity and confirms account details. During the transfer process, the customer may choose to schedule the transfer for a future date or add a remark to the transaction. If the transaction fails, the system can suggest alternative options such as retrying later or using another account. A Bank Teller can also assist customers through the system if necessary.

Scenario: Smart City Parking Management System

The Smart City Parking System allows a **Driver** to locate available parking spaces using a mobile app. The driver logs into the app to access parking services. The system provides options to search for nearby parking lots, filter results by price, distance, or facilities, and reserve a spot in advance. Once a spot is selected, the system always verifies the driver's vehicle registration and checks availability in real time before confirming the booking. After confirmation, the driver must proceed to payment through credit card, e-wallet, or mobile banking. During booking, the driver may choose to apply a membership discount or request additional services such as car washing or valet parking. If payment fails, the system can suggest alternative payment options. Upon arrival, the driver scans a QR code at the entrance to validate the booking. If the driver arrives late, the system may extend the reservation time with an additional fee.

Parking Enforcement Officers use the system to monitor bookings and issue penalties for violations. A **City Administrator** can generate reports on parking usage, revenue, and peak demand for planning purposes.
